Package 'DMMF'

April 26, 2023

Type Package

Title Daily Based Morgan-Morgan-Finney (DMMF) Soil Erosion Model

Version 0.5.2.0

Date 2023-04-26

Author Kwanghun Choi [aut, cre],
Sebastian Arnhold [dtc, ctb],
Bjoern Reineking [ths, ctb]

Maintainer Kwanghun Choi <kwanghun.choi@yahoo.com>

Description Implements the daily based Morgan-Morgan-Finney (DMMF) soil erosion model (Choi et al., 2017 <doi:10.3390/w9040278>) for estimating surface runoff and sediment budgets from a field or a catchment on a daily basis.

DMMF-package	*Daily Based Morgan–Morgan–Finney (DMMF) Soil Erosion Model*

Description

Implements the daily based Morgan–Morgan–Finney (DMMF) soil erosion model for estimating surface runoff and sediments budgets from a field or a catchment on a daily basis.

Details

This package is the implementation of the daily based Morgan–Morgan–Finney (DMMF) soil erosion model to estimate surface runoff and sediment budget of a field and a catchment on a daily basis.

The DMMF model is one of the variant of the widely used Morgan–Morgan–Finney soil erosion model and largely based on the modified MMF model with several modifications (see details in Choi et al. (2017)).

This R implementation of the DMMF model is suitable for estimating surface runoff and sediment budgets of fields or catchments represented by raster.

The package provides the DMMF function that estimates surface runoff and soil erosion using DMMF model, DMMF_Simple function which is the simpler version of the DMMF and SinkFill function that generates sink free map for the DMMF model based on the sink fill algorithm from Wang and Liu (2006) and the SAGA-GIS module of "Module Fill Sinks (Wang & Liu)" by Volker Wichmann (2007).

| DMMF | *Daily based Morgan–Morgan–Finney (DMMF) soil erosion model* |

Description

Estimating surface runoff and sediment budget using the Daily based Morgan–Morgan–Finney soil erosion model using the algorithm from Choi et al. (2017)

Usage

```
DMMF(DEM, R, RI, ET, P_c, P_z, P_s, theta_init, theta_sat, theta_fc,
     SD, K, P_I, n_s, CC, GC, IMP, PH, D, NV, d_a = 0.005,
     DK_c = 0.1, DK_z = 0.5, DK_s = 0.3,
     DR_c = 1.0, DR_z = 1.6, DR_s = 1.5,
     Breaking, Init_point, Sinks, R_Type = 0, slpMode = 2, ALL = TRUE)
```

Arguments

DEM	RasterLayer object of digital elevation model (DEM)
R	Numeric vector or RasterBrick object of daily rainfall per unit area (unit: mm)
RI	Numeric vector or RasterBrick object of mean hourly rainfall intensity during a day (unit: mm/h)
ET	Numeric vector or RasterBrick object of evapotranspiration per unit area (unit: mm)
P_c	Numeric vector or RasterLayer object of proportion of clay particles in surface soil (0-1)

P_z	Numeric vector or RasterLayer object of proportion of silt particles in surface soil (0-1)
P_s	Numeric vector or RasterLayer object of proportion of sand particles in surface soil (0-1)
theta_init	Numeric vector or RasterBrick object of initial soil water content of entire soil profile per unit area (unit: vol/vol)
theta_sat	Numeric vector or RasterLayer object of saturated soil water content of entire soil profile per unit area (unit: vol/vol)
theta_fc	Numeric vector or RasterLayer object of soil water content at field capacity of entire soil profile per unit area (unit: vol/vol)
SD	Numeric vector or RasterLayer object of soil depth of entire soil profile (unit: m)
K	Numeric vector or RasterLayer object of saturated lateral hydraulic conductivity of entire soil profile (unit: m/d)
P_I	Numeric vector or Raster* object of proportion of permanent interception area of rainfall (0-1)
n_s	Numeric vector or Raster* object of Manning's roughness coefficient of the soil surface (unit: $s/m^{1/3}$)
CC	Numeric vector or Raster* object of proportion of area with canopy cover (0-1)
GC	Numeric vector or Raster* object of proportion of area with pervious vegetated ground cover (0-1)
IMP	Numeric vector or Raster* object of proportion of area with impervious ground cover (0-1)
PH	Numeric vector or Raster* object of average height of vegetation or crop cover where leaf drainage start to fall (unit: m)
D	Numeric vector or Raster* object of average diameter of individual plant elements at the surface (unit: m)
NV	Numeric vector or Raster* object of number of individual plant elements per unit area (unit: $number/m^2$)
d_a	Numeric vector or Raster* object of typical flow depth of surface runoff (unit: m)
DK_c	Numeric vector or RasterLayer object of detachability of clay particles by rainfall (unit: g/J)
DK_z	Numeric vector or RasterLayer object of detachability of silt particles by rainfall (unit: g/J)
DK_s	Numeric vector or RasterLayer object of detachability of sand particles by rainfall (unit: g/J)
DR_c	Numeric vector or RasterLayer object of detachability of clay particles by surface runoff (unit: g/mm)
DR_z	Numeric vector or RasterLayer object of detachability of silt particles by surface runoff (unit: g/mm)
DR_s	Numeric vector or RasterLayer object of detachability of sand particles by surface runoff (unit: g/mm)

Breaking	Numeric vector of starting points of each simulation period (0: during the period points, 1: breaking points), If breaking is missing, by default the first day is set to 1 and the other days are set to 0.
Init_point	Numeric vector of starting points of each rainfall event (0: during the period points, 1: breaking points), If Init_point is missing, Init_point is set to Breaking by default.
Sinks	RasterLayer object of sinks (e.g., streams, reservoirs, and lakes) of sediments and surface runoff (optional).
R_Type	Integer object of each rainfall type for estimating kinetic energy of direct throughfall (DT) (0-8) (see details)
slpMode	Integer object of slope calculation algorithm (2: second order, 3: third order)
ALL	Logical object of selection for the entire output results

Details

R_Type can be chosen among options appropriate for each regions according to Morgan (2001) and Morgan (2005). Default option adopts recent universal relationships between kinetic energy density and mean hourly rainfall intensity (RI) from Shin et al. (2016). Default option is recommended when users have measured RI. Detailed descriptions are described below.

Option	Region	Kinetic energy density of throughfall [$J/m^2/mm$]
0	Universal (Default)	$10.3 \cdot RI^{2/9}$
1	North America	$11.87 + 8.73 \cdot \log_{10}(RI)$
2	North-west Europe	$8.95 + 8.44 \cdot \log_{10}(RI)$
3	Mediterranean	$9.81 + 11.25 \cdot \log_{10}(RI)$
4	West Mediterranean	$35.9 \cdot (1.0 - 0.56 \cdot \exp(-0.034 \cdot RI))$
5	Tropics	$29.8 - (127.5/RI)$
6	East Asia	$9.81 + 10.60 \cdot \log_{10}(RI)$
7	Temperate Southern hemisphere	$29.0 \cdot (1.0 - 0.6 \cdot \exp(-0.04 \cdot RI))$
8	Universal	$28.3 \cdot (1.0 - 0.52 \cdot \exp(-0.042 \cdot RI))$

Multi-flow direction algorithm (MD∞) from Seibert and McGlynn (2007) is built in the DMMF model.

Value

The output of the function DMMF is a list of RasterLayer or RasterBrick objects containing the following elements:

- A: Surface area size of each element considering slope (unit: m^2)
- Rf: The amount of effective rainfall reaching each element (unit: mm)
- SW_c: Surface water infiltration capacity of each element (unit: mm
- theta_r: Remaining soil water content of each element (unit: vol/vol)
- TC: Transport capacity of the runoff of each element (unit: kg/m^2)
- Q_in: Volume of surface runoff flowing into each element (unit: L)

- `Q_out`: Volume of surface runoff flowing from each element (unit: L)
- `IF_in`: Volume of subsurface water flowing into each element (unit: L)
- `IF_out`: Volume of subsurface water flowing from each element (unit: L)
- `SS_c`: Area density of clay delivered to surface runoff in unit area of each element (unit: $\mathrm{kg/m^2}$)
- `SS_z`: Area density of silt delivered to surface runoff in unit area of each element (unit: $\mathrm{kg/m^2}$)
- `SS_s`: Area density of sand delivered to surface runoff of each element (unit: $\mathrm{kg/m^2}$)
- `G_c`: Area density of available clay for transport by surface runoff of each element (unit: $\mathrm{kg/m^2}$)
- `G_z`: Area density of available silt for transport by surface runoff of each element (unit: $\mathrm{kg/m^2}$)
- `G_s`: Area density of available sand for transport by surface runoff of each element (unit: $\mathrm{kg/m^2}$)
- `SL_c_in`: Mass of clay inputs into each element (unit: kg)
- `SL_z_in`: Mass of silt inputs into each element (unit: kg)
- `SL_s_in`: Mass of sand inputs into each element (unit: kg)
- `SL_in`: Mass of sum of total sediments inputs into each element (unit: kg)
- `SL_c_out`: Mass of clay outputs from each element (unit: kg)
- `SL_z_out`: Mass of silt outputs from each element (unit: kg)
- `SL_s_out`: Mass of sand outputs from each element (unit: kg)
- `SL_out`: Mass of sum of total sediments outputs from each element (unit: kg)

DMMFc   *Daily based Morgan–Morgan–Finney (DMMF) soil erosion model*

Description

Estimating surface runoff and sediment budget using the Daily based Morgan–Morgan–Finney soil
erosion model using the algorithm from Choi et al. (2017)

Usage

```
DMMFc(DEM, R, RI, ET, P_c, P_z, P_s, theta_init, theta_sat, theta_fc, SD, K,
      P_I, n_s, CC, GC, IMP, PH, D, NV, d_a, DK_c, DK_z, DK_s, DR_c, DR_z, DR_s,
     SoilMap, LULCMap, Breaking, Init_point, Sinks, R_Type = 0, slpMode = 2, ALL = TRUE)
```

Arguments

DEM	RasterLayer object of digital elevation model (DEM)
R	Numeric vector or RasterBrick object of daily rainfall per unit area (unit: mm)
RI	Numeric vector or RasterBrick object of mean hourly rainfall intensity during a day (unit: mm/h)
ET	Numeric vector or RasterBrick object of evapotranspiration per unit area (unit: mm)
P_c	Numeric vector or RasterLayer object of proportion of clay particles in surface soil (0-1)
P_z	Numeric vector or RasterLayer object of proportion of silt particles in surface soil (0-1)
P_s	Numeric vector or RasterLayer object of proportion of sand particles in surface soil (0-1)
theta_init	Numeric vector or RasterBrick object of initial soil water content of entire soil profile per unit area (unit: vol/vol)
theta_sat	Numeric vector or RasterLayer object of saturated soil water content of entire soil profile per unit area (unit: vol/vol)
theta_fc	Numeric vector or RasterLayer object of soil water content at field capacity of entire soil profile per unit area (unit: vol/vol)
SD	Numeric vector or RasterLayer object of soil depth of entire soil profile (unit: m)
K	Numeric vector or RasterLayer object of saturated lateral hydraulic conductivity of entire soil profile (unit: m/d)
P_I	Numeric vector or Raster* object of proportion of permanent interception area of rainfall (0-1)
n_s	Numeric vector or Raster* object of Manning's roughness coefficient of the soil surface (unit: $\mathrm{s/m^{1/3}}$)
CC	Numeric vector or Raster* object of proportion of area with canopy cover (0-1)
GC	Numeric vector or Raster* object of proportion of area with pervious vegetated ground cover (0-1)
IMP	Numeric vector or Raster* object of proportion of area with impervious ground cover (0-1)
PH	Numeric vector or Raster* object of average height of vegetation or crop cover where leaf drainage start to fall (unit: m)
D	Numeric vector or Raster* object of average diameter of individual plant elements at the surface (unit: m)
NV	Numeric vector or Raster* object of number of individual plant elements per unit area (unit: $\mathrm{number/m^2}$)
d_a	Numeric vector or Raster* object of typical flow depth of surface runoff (unit: m)
DK_c	Numeric vector or RasterLayer object of detachability of clay particles by rainfall (unit: g/J)

DK_z	Numeric vector or RasterLayer object of detachability of silt particles by rainfall (unit: g/J)
DK_s	Numeric vector or RasterLayer object of detachability of sand particles by rainfall (unit: g/J)
DR_c	Numeric vector or RasterLayer object of detachability of clay particles by surface runoff (unit: g/mm)
DR_z	Numeric vector or RasterLayer object of detachability of silt particles by surface runoff (unit: g/mm)
DR_s	Numeric vector or RasterLayer object of detachability of sand particles by surface runoff (unit: g/mm)
SoilMap	Categorical raster map for soil characteristics
LULCMap	Categorical raster map for Land use and vegetation types
Breaking	Numeric vector of starting points of each simulation period (0: during the period points, 1: breaking points), If breaking is missing, by default the first day is set to 1 and the other days are set to 0.
Init_point	Numeric vector of starting points of each rainfall event (0: during the period points, 1: breaking points), If Init_point is missing, Init_point is set to Breaking by default.
Sinks	RasterLayer object of sinks (e.g., streams, reservoirs, and lakes) of sediments and surface runoff (optional).
R_Type	Integer object of each rainfall type for estimating kinetic energy of direct throughfall (DT) (0-8) (see details)
slpMode	Integer object of slope calculation algorithm (2: second order, 3: third order)
ALL	Logical object of selection for the entire output results

Details

R_Type can be chosen among options appropriate for each regions according to Morgan (2001) and Morgan (2005). Default option adopts recent universal relationships between kinetic energy density and mean hourly rainfall intensity (RI) from Shin et al. (2016). Default option is recommended when users have measured RI. Detailed descriptions are described below.

Option	Region	Kinetic energy density of throughfall [$\mathrm{J/m^2/mm}$]
0	Universal (Default)	$10.3 \cdot \mathrm{RI}^{2/9}$
1	North America	$11.87 + 8.73 \cdot \log_{10}(\mathrm{RI})$
2	North-west Europe	$8.95 + 8.44 \cdot \log_{10}(\mathrm{RI})$
3	Mediterranean	$9.81 + 11.25 \cdot \log_{10}(\mathrm{RI})$
4	West Mediterranean	$35.9 \cdot (1.0 - 0.56 \cdot \exp(-0.034 \cdot \mathrm{RI}))$
5	Tropics	$29.8 - (127.5/\mathrm{RI})$
6	East Asia	$9.81 + 10.60 \cdot \log_{10}(\mathrm{RI})$
7	Temperate Southern hemisphere	$29.0 \cdot (1.0 - 0.6 \cdot \exp(-0.04 \cdot \mathrm{RI}))$
8	Universal	$28.3 \cdot (1.0 - 0.52 \cdot \exp(-0.042 \cdot \mathrm{RI}))$

Multi-flow direction algorithm (MD∞) from Seibert and McGlynn (2007) is built in the DMMF model.

Value

The output of the function DMMF is a list of RasterLayer or RasterBrick objects containing the following elements:

- A: Surface area size of each element considering slope (unit: m^2)
- Rf: The amount of effective rainfall reaching each element (unit: mm)
- SW_c: Surface water infiltration capacity of each element (unit: mm
- theta_r: Remaining soil water content of each element (unit: vol/vol)
- TC: Transport capacity of the runoff of each element (unit: $\mathrm{kg/m}^2$)
- Q_in: Volume of surface runoff flowing into each element (unit: L)
- Q_out: Volume of surface runoff flowing from each element (unit: L)
- IF_in: Volume of subsurface water flowing into each element (unit: L)
- IF_out: Volume of subsurface water flowing from each element (unit: L)
- SS_c: Area density of clay delivered to surface runoff in unit area of each element (unit: $\mathrm{kg/m}^2$)
- SS_z: Area density of silt delivered to surface runoff in unit area of each element (unit: $\mathrm{kg/m}^2$)
- SS_s: Area density of sand delivered to surface runoff of each element (unit: $\mathrm{kg/m}^2$)
- G_c: Area density of available clay for transport by surface runoff of each element (unit: $\mathrm{kg/m}^2$)
- G_z: Area density of available silt for transport by surface runoff of each element (unit: $\mathrm{kg/m}^2$)
- G_s: Area density of available sand for transport by surface runoff of each element (unit: $\mathrm{kg/m}^2$)
- SL_c_in: Mass of clay inputs into each element (unit: kg)
- SL_z_in: Mass of silt inputs into each element (unit: kg)
- SL_s_in: Mass of sand inputs into each element (unit: kg)
- SL_in: Mass of sum of total sediments inputs into each element (unit: kg)
- SL_c_out: Mass of clay outputs from each element (unit: kg)
- SL_z_out: Mass of silt outputs from each element (unit: kg)
- SL_s_out: Mass of sand outputs from each element (unit: kg)
- SL_out: Mass of sum of total sediments outputs from each element (unit: kg)

DMMF_Simple	*Simplified Daily based Morgan–Morgan–Finney (DMMF) soil erosion model for one element during a day*

Description

This is the simplified version of DMMF for simple one element (cell) during a day

Usage

```
DMMF_Simple( W, L = W/cos(S), S, R, RI, ET,
             P_c, P_z, P_s, theta_init, theta_sat, theta_fc,
             SD, K, P_I, n_s, CC, GC, IMP, PH, D, NV, d_a = 0.005,
           DK_c = 0.1, DK_z = 0.5, DK_s = 0.3, DR_c = 1.0, DR_z = 1.6, DR_s = 1.5,
           Q_in = 0, IF_in = 0, SL_c_in = 0, SL_z_in = 0, SL_s_in = 0, R_type = 0)
```

Arguments

W	Width of an element (cell) (unit: m)
L	Length of an element (cell) (unit: m). If L is not specified, the function assumes L as W/cos(S) (i.e., The function assumes a cell as a subset of DEM with slope angle of S).
S	Slope angle of an element (cell) (unit: rad)
R	Daily rainfall per unit area (unit: mm)
RI	Mean hourly rainfall intensity during a day (unit: mm/h)
ET	Evapotranspiration per unit area (unit: mm)
P_c	Proportion of clay particles in surface soil (0-1)
P_z	Proportion of silt particles in surface soil (0-1)
P_s	Proportion of sand particles in surface soil (0-1)
theta_init	Initial soil water content of entire soil profile per unit area (unit: vol/vol)
theta_sat	Saturated soil water content of entire soil profile per unit area (unit: vol/vol)
theta_fc	Soil water content at field capacity of entire soil profile per unit area (unit: vol/vol)
SD	Soil depth of entire soil profile (unit: m)
K	Saturated lateral hydraulic conductivity of entire soil profile (unit: m/d)
P_I	Proportion of permanent interception area of rainfall (0-1)
n_s	Manning's roughness coefficient of the soil surface (unit: $s/m^{1/3}$)
CC	Proportion of area with canopy cover (0-1)
GC	Proportion of area with pervious vegetated ground cover (0-1)
IMP	Proportion of area with impervious ground cover (0-1)
PH	Average height of vegetation or crop cover where leaf drainage start to fall (unit: m)
D	Average diameter of individual plant elements at the surface (unit: m)
NV	A number of individual plant elements per unit area (unit: $number/m^2$)
d_a	Typical flow depth of surface runoff (unit: m)
DK_c	Detachability of clay particles by rainfall (unit: g/J)
DK_z	Detachability of silt particles by rainfall (unit: g/J)
DK_s	Detachability of sand particles by rainfall (unit: g/J)
DR_c	Detachability of clay particles by surface runoff (unit: g/mm)
DR_z	Detachability of silt particles by surface runoff (unit: g/mm)
DR_s	Detachability of sand particles by surface runoff (unit: g/mm)
Q_in	The volume of surface runoff from outside of an element (cell) (unit: L)
IF_in	The volume of subsurface interflow from outside of an element (cell) (unit: L)
SL_c_in	The mass of clay particles from outside of an element (cell) (unit: kg)
SL_z_in	The mass of silt particles from outside of an element (cell) (unit: kg)
SL_s_in	The mass of sand particles from outside of an element (cell) (unit: kg)
R_type	Integer object of each rainfall type for estimating kinetic energy of direct throughfall (DT) (0-8) (see details)

Details

Detailed information about options of R_type can be found in details of DMMF.
This function is suitable for projecting the DMMF model for a field represented in one element during a day.

Value

The output of the function DMMF_Simple is a data frame that contains following numeric elements:

- Q_out: Volume of surface runoff flowing from the element (unit: L)

- IF_out: Volume of subsurface water flowing from the element (unit: L)

- theta_r: Remaining soil water content of the element (unit: vol/vol)

- SL_c_out: Mass of clay outputs from the element (unit: kg)

- SL_z_out: Mass of silt outputs from the element (unit: kg)

- SL_s_out: Mass of sand outputs from the element (unit: kg)

- A: Surface area of the element (unit: m^2)

MapChecker   *Map checker for raster layers*

Description

Simple boundary, sink and stand checker for DEMs (Digital Elevation Models).

Usage

```
MapChecker( DEM )
```

Arguments

DEM   RasterLayer object of digital elevation model (DEM) which needs sinkfill for
               DMMF model

Details

Simple boundary, sink and stand checker for DEMs (Digital Elevation Models). The code defines a
cell as a

- boundary: when there are at least one NA values and at least one cell with valid value in
  adjacent cells.
- sink: when all adjacent cells of it are higher than the target cell.
- stand: when all adjacent cells of it are higher than or equal to the target cell.

Value

The output of the function MapChecker is a RasterLayer object of the boundary, sink, and stand.

Examples

```
## Not run:
## Load example data for test running B_Checker function
data(Potato.Convex)
attach(Potato.Convex)
## Run B_Checker function with original DEM which has internal sinks.
DEM <- s.map$DEM_original
MapCheck <- MapChecker( DEM )
## Check maps
par(mfrow=c(2,2))
plot(DEM)
plot(MapCheck$boundary)
plot(MapCheck$sink)
plot(MapCheck$stand)

## End(Not run)
```

Potato.Concave   *Example data from the concave potato field from Arnhold et al. (2013)*

Description

Example input data for running the DMMF function. This data is based on the field data from the concave potato field described in Arnhold et al. (2013) with optimized parameters described in Choi et al. (2017).

Usage

```
data(Potato.Concave)
```

Value

Potato.Concave contains input data for the DMMF including map type and numeric type variables. Static variables are fixed and do not change with time (or period). Dynamic variables change with time (or period).
s.map: Static input maps for the DMMF model.

- DEM_original: RasterLayer object of original digital elevation model (DEM) of the concave potato field before filling sinks.
- DEM: RasterLayer object of DEM after applying sinkfill algorithm.
- IMP: RasterLayer object of the proportion of area covered with impervious surface cover.
- n_s: RasterLayer object of the Manning's roughness coefficient of the soil surface.

d.map: Dynamic input maps for the DMMF model.

- theta_init: RasterStack object of the initial soil water content of entire soil profile for each rainfall period.

s.var: Static input numeric variables for the DMMF model.

- P_c: Numeric object of proportion of clay particles in surface area.
- P_z: Numeric object of proportion of silt particles in surface area.
- P_s: Numeric object of proportion of sand particles in surface area.
- theta_sat: Numeric object of saturated soil water content of entire soil profile.
- theta_fc: Numeric object of soil water content at field capacity of entire soil profile.
- SD: Numeric object of soil depth.
- K: Numeric object of saturated lateral hydraulic conductivity which is obtained from model calibration described in Choi et al. (2017).
- P_I: Numeric object of proportion of permanent interception area of rainfall.

- GC: Numeric object of proportion of area with pervious vegetated ground cover.
- D: Numeric object of average diameter of individual plant elements at the surface.
- NV: Numeric object of number of individual plant elements per unit area.
- d_a: Numeric object of typical flow depth of surface runoff.
- DK_c: Numeric of detachability of clay particles by rainfall.
- DK_z: Numeric of detachability of silt particles by rainfall.
- DK_s: Numeric of detachability of sand particles by rainfall.
- DR_c: Numeric of detachability of clay particles by surface runoff.
- DR_z: Numeric of detachability of silt particles by surface runoff.
- DR_s: Numeric of detachability of sand particles by surface runoff.

d.var: Dynamic input numeric variables for the DMMF model.

- R: Numeric vector object of daily rainfall per unit area.
- RI: Numeric vector object of mean hourly rainfall intensity during a day.
- ET: Numeric vector object of evapotranspiration per unit area.
- CC: Numeric vector object of proportion of area with canopy cover.
- PH: Numeric vector or object of average height of vegetation or crop cover where leaf drainage start to fall
- Breaking: Numeric vector of starting points of each simulation period.
- Init_point: Numeric vector of starting points of each rainfall event.

Potato.Convex   *Example data from the convex potato field from Arnhold et al. (2013)*

Description

Example input data for running the [DMMF] function. This data is based on the field data from the convex potato field described in Arnhold et al. (2013) with optimized parameters described in Choi et al. (2017).

Usage

```
data(Potato.Convex)
```

Value

`Potato.Convex` contains input data for the [DMMF] including map type and numeric type variables. Static variables are fixed and do not change with time (or period). Dynamic variables change with time (or period).
s.map: Static input maps for the [DMMF] model.

- `DEM_original`: RasterLayer object of original digital elevation model (DEM) of the convex potato field before filling sinks.
- `DEM`: RasterLayer object of DEM after applying sinkfill algorithm.
- `IMP`: RasterLayer object of the proportion of area covered with impervious surface cover.
- `n_s`: RasterLayer object of the Manning's roughness coefficient of the soil surface.

d.map: Dynamic input maps for the [DMMF] model.

- `theta_init`: RasterStack object of the initial soil water content of entire soil profile for each rainfall period.

s.var: Static input numeric variables for the [DMMF] model.

- `P_c`: Numeric object of proportion of clay particles in surface area.
- `P_z`: Numeric object of proportion of silt particles in surface area.
- `P_s`: Numeric object of proportion of sand particles in surface area.
- `theta_sat`: Numeric object of saturated soil water content of entire soil profile.
- `theta_fc`: Numeric object of soil water content at field capacity of entire soil profile.
- `SD`: Numeric object of soil depth.
- `K`: Numeric object of saturated lateral hydraulic conductivity which is obtained from model calibration described in Choi et al. (2017).
- `P_I`: Numeric object of proportion of permanent interception area of rainfall.

- GC: Numeric object of proportion of area with pervious vegetated ground cover.
- D: Numeric object of average diameter of individual plant elements at the surface.
- NV: Numeric object of number of individual plant elements per unit area.
- d_a: Numeric object of typical flow depth of surface runoff.
- DK_c: Numeric of detachability of clay particles by rainfall.
- DK_z: Numeric of detachability of silt particles by rainfall.
- DK_s: Numeric of detachability of sand particles by rainfall.
- DR_c: Numeric of detachability of clay particles by surface runoff.
- DR_z: Numeric of detachability of silt particles by surface runoff.
- DR_s: Numeric of detachability of sand particles by surface runoff.

d.var: Dynamic input numeric variables for the DMMF model.

- R: Numeric vector object of daily rainfall per unit area.
- RI: Numeric vector object of mean hourly rainfall intensity during a day.
- ET: Numeric vector object of evapotranspiration per unit area.
- CC: Numeric vector object of proportion of area with canopy cover.
- PH: Numeric vector or object of average height of vegetation or crop cover where leaf drainage start to fall
- Breaking: Numeric vector of starting points of each simulation period.
- Init_point: Numeric vector of starting points of each rainfall event.

SinkFill   *Sinkfill algorithm based on Wang and Liu (2006)*

Description

Implementation of sinkfill algorithm based on Wang and Liu (2006).

Usage

```
SinkFill( DEM, Boundary, min_angle = 0.00001)
```

Arguments

DEM	RasterLayer object of digital elevation model (DEM) which needs sinkfill for DMMF model
Boundary	RasterLayer object for setting the locations of local sinks in the DEM, if Boundary is missing, every boundary cells of the map are set as potential sinks of the map.
min_angle	Numeric object of angle to make slope between cells (unit: rad)

Details

The function is the implementation of sink-fill algorithm from Wang and Liu (2006), which is already implemented as a SAGA-GIS module (see Wichmann (2007)).
The function SinkFill is modified from the original algorithm with including the option to set the initial boundary manually (e.g., global sink of the field).

Value

If Boundary is missing, function automatically identifies internal and external boundary of the input DEM which is in contact with cells having NaN value. The output of the function SinkFill is a list of RasterLayer objects of the sinkfilled DEM ($nosink) and partitions ($partition) of the area for the DMMF model.
